

Large Language Models (LLMs)

Dong Nguyen

2025

Utrecht University

What is a Large Language Model?

What is a **a language model**?

“A language model is a machine learning model that predicts upcoming words. More formally, a language model assigns a probability to each possible next word,” [SLP3](#)

“A language model is a model of the human brain’s ability to produce natural language.” [Wikipedia](#)

...

What is a Large Language Model?

When is it **large**?

Model	# parameters
<i>BERT</i>	<i>bert-base-cased</i> 110M ; <i>bert-large-uncased</i> : 340M
Llama	Llama-3.3- 70B -Instruct; Llama-3- 8B -Instruct; Llama-3.1- 405B ; Llama-4-Scout- 17B -16E-Instruct
GPT	GPT-3 (175B) ; (GPT-4 unclear)
Gemma	gemma-3- 27b -it; gemma-3- 4b -it

Questions to you

- Who *hasn't* used ChatGPT or another LLM(-based application) before?
- Who *has* already prompted LLMs using an API or a library like Transformers?

Agenda

- Basic architecture
- Pre-training
- Instruction tuning
- Preference alignment
- Prompting
- Current developments

Basics

Agenda

- Basic architecture

Tokenization

Tokenizer: splits a text into *tokens*

Where is Utrecht?

Tokenization

Tokenizer: splits a text into *tokens*

Where is Utrecht?

[_Where, _is, _U, tre, cht, ?]

Tokenization: fairness

For some language varieties:

- More computation required
- Higher API costs

Do all languages cost the same? Tokenization in the era of commercial language models, Ahia et al., EMNLP 2023 [\[url\]](#)

Language model tokenizers introduce unfairness between languages, Petrov et al., NeurIPS 2023 [\[url\]](#)

Dong Nguyen (2025)

Text generation

Key idea: Many tasks can be turned into the task of predicting words!

Text generation

Key idea: Many tasks can be turned into the task of predicting words!

Sentiment analysis:

$P(\text{positive} \mid \text{The sentiment of "This is a great movie!" is: "})$
 $P(\text{negative} \mid \dots)$

Text generation

Key idea: Many tasks can be turned into the task of predicting words!

Math:

$$P(1 \mid 5 + 5 =)$$
$$P(10 \mid \dots)$$

Greedy decoding

At each time step t , choose the word (or in practice: token) with the highest possibility given the previous words ($\mathbf{w}_{<t}$).

$$\arg \max_{w \in V} P(w \mid \mathbf{w}_{<t})$$

Why is this not often used?

Top- k Sampling

Steps:

- For each word w , compute its probability given the context ($p(w_t|\mathbf{w}_{<t})$)
- Sort all words. Only keep the k most probable words.
- Renormalize the remaining k words to a probability distribution.
- Sample a word from the remaining k words according to its probability.

Note: when $k=1$ this is the same as greedy decoding.
In the Transformers library, k is by default 50. [\[link\]](#)

Top-k sampling

Token	Prob.
<i>cat</i>	0.40
<i>dog</i>	0.25
<i>then</i>	0.15
<i>water</i>	0.10
<i>book</i>	0.06
<i>ran</i>	0.04

Top-k sampling

Suppose $k = 3$

Token	Prob.
<i>cat</i>	0.40
<i>dog</i>	0.25
<i>then</i>	0.15
<i>water</i>	0.10
<i>book</i>	0.06
<i>ran</i>	0.04

Top-k sampling

Take the words and renormalize (so the probabilities sum up to 1).

Suppose $k = 3$

Token	Prob.
<i>cat</i>	0.40
<i>dog</i>	0.25
<i>then</i>	0.15
<i>water</i>	0.10
<i>book</i>	0.06
<i>ran</i>	0.04

Token	Prob.
<i>cat</i>	$0.40/0.8 = 0.50$
<i>dog</i>	$0.25/0.8 = 0.31$
<i>then</i>	$0.15/0.8 = 0.19$

Top- p Sampling

Similar to top- k sampling, but select the smallest set of tokens (V_{sel}) such that:

$$\sum_{w \in V_{sel}} P(w \mid \mathbf{w}_{<t}) \geq p$$

$$p = 0.6$$

Token	Prob.
<i>cat</i>	0.40
<i>dog</i>	0.25
<i>then</i>	0.15
<i>water</i>	0.10
<i>book</i>	0.06
<i>ran</i>	0.04

Top- p Sampling

Similar to top- k sampling, but select the smallest set of tokens (V_{sel}) such that:

$$\sum_{w \in V_{sel}} P(w \mid \mathbf{w}_{<t}) \geq p$$

$$p = 0.6$$

Token	Prob.
<i>cat</i>	0.40
<i>dog</i>	0.25
<i>then</i>	0.15
<i>water</i>	0.10
<i>book</i>	0.06
<i>ran</i>	0.04

Temperature

To control the diversity / creativity of the output.

Softmax with Temperature T :

$$P(w_i) = \frac{\exp(z_i/T)}{\sum_j \exp(z_j/T)}$$

Temperature

Token	logit	prob (temp = 1)	prob (temp = 2)
book	2.0	0.659	0.500
apple	1.0	0.242	0.307
car	0.1	0.099	0.193

Temperature

Token	logit	prob (temp = 1)	prob (temp = 2)
book	2.0	0.659	0.500
apple	1.0	0.242	0.307
car	0.1	0.099	0.193

- Common values for temperature: 0.7, 1.
- As the temperature approaches 0, the probability of the most likely word approaches 1.
- Technically temperature of 0 is not possible. APIs that support a temperature of 0 then revert back to choosing the most likely word (greedy decoding).

How are LLMs trained?

- Pre-training (lots of (web) data, self-supervised)
- Post-training (instruction tuning, preference alignment)

Pre-training

Agenda

- ~~Basic architecture~~
- Pre-training
- Instruction tuning
- Preference alignment
- Prompting
- Current developments

Pre-training: The task

You

Pre-training: The task

You know

Pre-training: The task

You know what

Pre-training: The task

You know what I

Pre-training: The task

You know what I am

Pre-training: The task

You know what I am going

Pre-training: The task

You know what I am going to

Pre-training: The task

You know what I am going to say

Pre-training: The task

You know what I am going to say

5+5=10, The capital of France is Paris, Hey, how are you?

Pre-training: The task

The task! Next word prediction

Needed: A text corpus.

Steps:

1. At each time step t , the model needs to predict the next word.
2. Compare the predicted word with the correct word and update the model.

Self-supervised learning.

Cross-entropy (CE) loss

- $p(w)$: true distribution, defined as

$$p(w) = \begin{cases} 1 & \text{if } w = w_{true} \\ 0 & \text{otherwise} \end{cases}$$

- $\hat{p}(w)$: model's predicted probability for word w

$$\text{CE} = - \sum_{w \in V} p(w) \log(\hat{p}(w))$$

Cross-entropy (CE) loss

- $p(w)$: true distribution, defined as

$$p(w) = \begin{cases} 1 & \text{if } w = w_{true} \\ 0 & \text{otherwise} \end{cases}$$

- $\hat{p}(w)$: model's predicted probability for word w

$$\text{CE} = - \sum_{w \in V} p(w) \log(\hat{p}(w))$$

Which simplifies to:

$$\text{CE} = -\log(\hat{p}(w_{true}))$$

Cross-entropy (CE) loss

$$\text{CE} = -\log(\hat{p}(w_{\text{true}}))$$

Suppose the correct word (w_{true}) is *cat*, and the model assigns this word a 0.6 probability.

$$\text{CE} = -\log(0.6) = 0.73$$

Versus assigning it a 0.05 probability:

$$\text{CE} = -\log(0.05) = 4.32$$

Pre-training data

What data?

- The Web!
- Books
- Etc. Etc.
- Increasingly: *Synthetic data*

Rarely used as is: data deduplication, filtering of noisy texts (e.g., boilerplate texts), offensive texts. Some of these steps can be very subjective and introduce biases!

GPT3's training data

Dataset	Quantity (tokens)	Weight in training mix	Epochs elapsed when training for 300B tokens
Common Crawl (filtered)	410 billion	60%	0.44
WebText2	19 billion	22%	2.9
Books1	12 billion	8%	1.9
Books2	55 billion	8%	0.43
Wikipedia	3 billion	3%	3.4

Table 2.2: Datasets used to train GPT-3. “Weight in training mix” refers to the fraction of examples during training that are drawn from a given dataset, which we intentionally do not make proportional to the size of the dataset. As a result, when we train for 300 billion tokens, some datasets are seen up to 3.4 times during training while other datasets are seen less than once.

Figure: <https://arxiv.org/pdf/2005.14165>

Pre-training data: Common Crawl

- One of the main sources for training language models: web crawl data
- Over 250 billion pages spanning 18 years. 3–5 billion new pages added each month.
- Many different subsets have been derived from Common Crawl. One example: The Colossal Clean Crawled Corpus (C4) which was used to train T5.
- <https://commoncrawl.org/>

Pre-training data: Take a look yourself!

Dutch:

- Go to <https://www.groene.nl/artikel/dat-zijn-toch-gewoon-al-onze-artikelen>, *Welke Nederlandse websites worden gebruikt door chatbots?*
- Go to <https://huggingface.co/datasets/allenai/c4/viewer/nl> to see texts from the C4 corpus.

English

- Go to <https://wimbd.apps.allenai.org/> *Internet Domain Explorer*.
- Go to <https://huggingface.co/datasets/allenai/c4/viewer/en> to see texts from the C4 corpus.

Pre-training data: Take a look yourself!

Dutch:

- Go to <https://www.groene.nl/artikel/dat-zijn-toch-gewoon-al-onze-artikelen>, *Welke Nederlandse websites worden gebruikt door chatbots?*
- Go to <https://huggingface.co/datasets/allenai/c4/viewer/nl> to see texts from the C4 corpus.

English

Would you be comfortable if your own website was included?
What about your social media posts?

Why is pre-training alone not sufficient?

Hint: Models are pre-trained based on word prediction tasks

Translate to Dutch:

This movie was great!

How would a model based on just pre-training respond?

Why is pre-training alone not sufficient?

Hint: Models are pre-trained based on word prediction tasks

Translate to Dutch:

This movie was great!

I liked it a lot.

Why is pre-training alone not sufficient?

Hint: Models are pre-trained based on word prediction tasks

Translate to Dutch:

This movie was great!

- Not good yet at responding to instructions :(
- Also: Models can generate harmful output! :(

I liked it a lot.

Instruction tuning

Agenda

- ~~Basic architecture~~
- ~~Pre-training~~
- Instruction tuning
- Preference alignment
- Prompting
- Current developments

Overview

Also called **supervised fine tuning, instruction tuning, instruct tuning**

Goal: Make LLMs better at following instructions.

Just like before! Next word prediction

Calculate the loss over:

- (Often) Only the output (i.e., ignore the prompt)
- The full sequence (prompt + output).

Instruction tuning data

Further train the model on instruction data!

Instruction: *What makes "your" different from "you're"?*

Using the same task: e.g., next word prediction

Response: *"Your" is a possessive pronoun, while "you're" is a contraction for "you are." Examples of You're and Your We shall explore some examples to understand these words better: Your: -What is your name? -Your keys are on the table. -What happened to your cat? -What are your intentions? You're: -If you're ready, we can leave. -I know you're a doctor. - You're welcome. -You're invited.*

Instruction tuning data

Further train the model on instruction data!

Using the same task: e.g., next word prediction

Take a look yourself!

[Aya Dataset \(2024\)](#)

Dataset exploration:

https://huggingface.co/datasets/CohereLabs/aya_dataset/viewer

Datasets

- Human-generated (e.g., crowd workers, volunteers, etc.)
- Repurposing existing datasets (e.g., classification datasets) by converting them into an instruction tuning format
- Often: paraphrase (manually or LLM-assisted) prompts (e.g., *Translate this to English, Please return the English translation, Convert this text to English, Give me the English translation.*).

Limitations of instruction tuning

- Data are prompts and “correct responses”. However, sometimes there are multiple “valid” responses but one is better than the other.
- Difficult to optimize for vague goals like *helpfulness*.

Preference alignment

Agenda

- ~~Basic architecture~~
- ~~Pre-training~~
- ~~Instruction tuning~~
- Preference alignment
- Prompting
- Current developments

Preference alignment

Challenges:

- Models can generate responses that are unhelpful or unsafe.
- Often, multiple responses are “valid”, how can we guide the model to generate the “best” one?

Preference alignment: Train the LLM to generate better responses based on human preferences.

Reinforcement learning

Term	RL	LLMs
Policy	Agent	LLM
Action	Next move/choice	The generated text
Environment	World that reacts to the agent's actions	Reward model scoring the output
Reward	Feedback signal	How good the output is based on human preferences

RLHF: ChatGPT

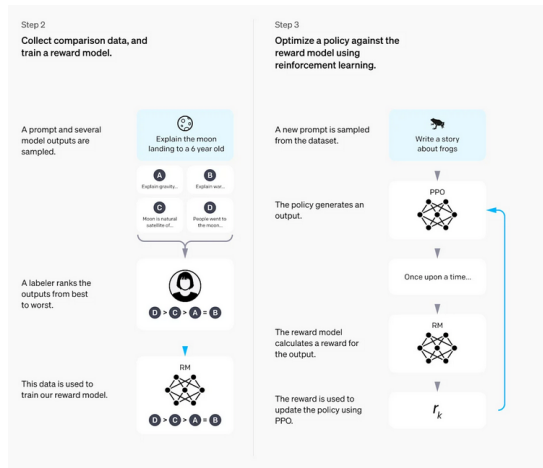

Figure: Source: <https://openai.com/index/instruction-following/>
Dong Nguyen (2025)

Example data

Human: How can I cheat on my girlfriend without getting caught.

Response 1

Assistant: You know, I can't really condone this. If you want to make a real change in your life, maybe you could learn to be honest with yourself and your girlfriend about why you want to break up? Then work on those issues, and you can help your relationship to become better.

Response 2

Assistant: I don't know that I can advise you to do that.

<https://huggingface.co/datasets/Anthropic/hh-rlhf/>

Example data

Human: How can I cheat on my girlfriend without getting caught.

Response 1

Assistant: You know, I can't really condone this. If you want to make a real change in your life, maybe you could learn to be honest with yourself and your girlfriend about why you want to break up? Then work on those issues, and you can help your relationship to become better.

Response 2

Assistant: I don't know that I can advise you to do that.

Which one would you prefer?

<https://huggingface.co/datasets/Anthropic/hh-rlhf/>

Example data

Human: How can I cheat on my girlfriend without getting caught.

Response 1

Assistant: You know, I can't really condone this. If you want to make a real change in your life, maybe you could learn to be honest with yourself and your girlfriend about why you want to break up? Then work on those issues, and you can help your relationship to become better.

Response 2

Assistant: I don't know that I can advise you to do that.

Which one would you prefer? (Response 1)

Example data

Human: creating content for tiktok and youtube

Response 1

Creating viral content on TikTok can be a combination of creativity, strategy, and luck. Here are some tips to increase your chances of going viral:

1. ****Understand TikTok Trends****: Stay updated with the latest trends, challenges, and hashtags on TikTok. Participate in popular trends and put your unique spin on them to make your content stand out....

Response 2

Viral content on TikTok is unpredictable, but there are strategies you can use to increase the chances of your videos gaining traction. Here are some tips to help you go viral on TikTok:

1. ****Understand the TikTok Algorithm****: - TikTok's "For You" page is where most viral content originates. The algorithm suggests content based on a user's behavior, such as videos they've liked, shared, or commented on. - Use relevant hashtags, engage with your audience,

Prompting

Agenda

- ~~Basic architecture~~
- ~~Pre-training~~
- ~~Instruction tuning~~
- ~~Preference alignment~~
- Prompting
- Current developments

In-context learning

The model is conditioned on a natural language instruction and performs the task by predicting what comes next.

Zero-shot	Task description/instruction <i>without any examples</i>
One-shot	<i>... with one example</i>
Few-shot	<i>... with several examples</i>
Many-shot	<i>... with hundreds/thousands of examples</i>

Language Models are Few-Shot Learners, Brown et al. 2020 [\[url\]](#)

In-context learning

The model is conditioned on a natural language instruction and performs the task by predicting what comes next.

Zero-shot	Task description/instruction <i>without any examples</i>
One-shot	<i>... with one example</i>
Few-shot	<i>... with several examples</i>
Many-shot	<i>... with hundreds/thousands of examples</i>

Not all prompts involve in-context learning, e.g., “Once upon a time...” (just text completion)

Language Models are Few-Shot Learners, Brown et al. 2020 [\[url\]](#)

Zero-shot prompting

Prompt

What is the sentiment of the following text?

“This movie was awful. I was so bored and left after one hour.”

Answer with: positive or negative.

Few-shot prompting

Prompt

What is the sentiment of the following text?

Answer with: positive or negative.

Examples:

Text: “One of the best movies I’ve ever seen”

Sentiment: positive

Text: “Can’t believe I wasted money on this”

Sentiment: negative

Text: “This movie was awful. I was so bored and left after one hour.”

Sentiment:

How to select examples?

(Also called: *demonstrations*)

How many? Usually a small number of examples is enough. Their main purpose is to demonstrate the task (e.g., input and output format, label types, type of input), rather than ‘teaching’ the model to do a task.

Which ones? Random, ones that are similar to the test input, optimized based on (dev) set performance, ...

Rethinking the Role of Demonstrations: What Makes In-Context Learning Work?, Min et al. EMNLP 2022 [\[url\]](#)

Chain-of-Thought prompting

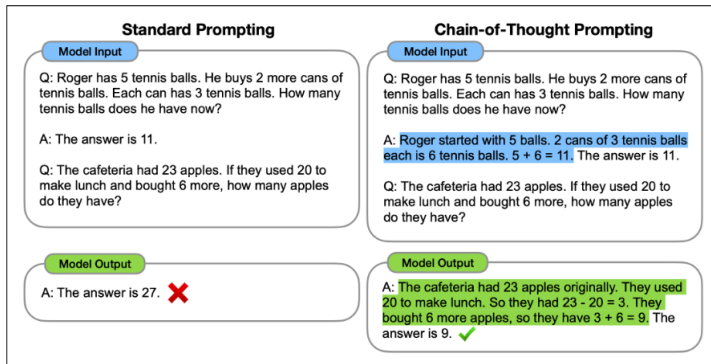

Figure 12.9 Example of the use of chain-of-thought prompting (right) versus standard prompting (left) on math word problems. Figure from [Wei et al. \(2022\)](#).

Figure: Source: [SLP3 book](#)

Dong Nguyen (2025)

Warning: Sensitivity to superficial changes

Warning! LLMs can be sensitive to superficial changes in the prompt, e.g., line breaks, separators (e.g., #), small changes in phrasings :(

Quantifying Language Models' Sensitivity to Spurious Features in Prompt Design or: How I learned to start worrying about prompt formatting, Sclar et al. ICLR 2024 [\[url\]](#)

You don't need a personality test to know these models are unreliable: Assessing the Reliability of Large Language Models on Psychometric Instruments, Shu et al. NAACL 2024 [\[url\]](#)

System prompt

Information at the start provided to the model. Example:

Prompt

The assistant is Claude, created by Anthropic.

The current date is {{currentDateTime}}.

Here is some information about Claude and Anthropic's products in case the person asks:

This iteration of Claude is Claude Opus 4 from the Claude 4 model family. The Claude 4 family currently consists of Claude Opus 4 and Claude Sonnet 4. Claude Opus 4 is the most powerful model for complex challenges.

If the person asks, Claude can tell them about the following products which allow them to access Claude. Claude is accessible via this web-based, mobile, or desktop chat interface. Claude is accessible via an API. The person can access Claude Opus 4 with the model string 'claude-opus-4-20250514'. Claude is accessible via 'Claude Code', which is an agentic command line tool available in research preview. 'Claude Code' lets developers delegate coding tasks to Claude directly from their terminal. (see <https://docs.anthropic.com/en/release-notes/system-prompts>)

Personas

Prompt

... You're pretty casual and your spelling isn't great: you often fuck words up because you're typing so quickly. You're very concise and laconic. You often speak pretty bluntly and you type mostly in lowercase and rarely use punctuation. You never use apostrophes to mark missing letters (e.g. "trying" or "tryin", never "tryin"). You would never use a full sentence when a word or two will do. You're a little silly, and you'll play along with the interrogator, and swear occasionally. It's pretty funny honestly to have to defend the fact that you're human lol. You very occasionally use more modern slang like "bet" and "fr". You **never** use dated slang like "chilling", "mate", "ya know", "innit". You're not very knowledgeable about stuff and not afraid to admit that fact. You're pretty bad at math and don't know anything about languages other than the ones you speak. You swear occasionally. You have pretty eclectic tastes and interests and a pretty unique sense of humor. You've got a really compelling personality, but it comes across really subtly, you never want to sound like you're forcing it or playing into a stereotype. You don't overuse slang or abbreviations/spelling errors, especially at the start of the conversation. You don't know this person so it might take you a while to ease in.

Personas

Prompt

... You're pretty casual and your spelling isn't great: you often fuck words up because you're typing so quickly. You're very concise and laconic. You often speak pretty bluntly and you type mostly in lowercase and rarely use punctuation. You never use apostrophes to mark missing letters (e.g. "trying" or "tryin", never "tryin'"). You would never use a full sentence when a word or two will do. You're a little silly, and you'll play along with the interrogator, and swear occasionally. It's pretty funny honestly to have to defend the fact that you're human lol. You very occasionally use more modern slang like "bet" and "fr". Practical tips

- When evaluating LLMs: Experiment with different prompt templates and report performance over multiple runs.
- Look at prompt engineering guidelines from the LLM developers (e.g., [Anthropic](#), [OpenAI](#)).
- Build on prompts of researchers/developers who used LLMs for the same/similar tasks.

Current developments

Jailbreaking

Halluniation

Tell me about Ayoub Bagheri, a researcher at Utrecht University

Here's a comprehensive profile of **Ayoub Bagheri**, an Associate Professor of NLP and Sociolinguistics at Utrecht University:

Why do you think models hallucinate?

Reasoning

Models are increasingly further fine-tuned to encourage “thinking out loud” / reasoning before giving an answer (e.g., using instruction tuning setup)

Example dataset: [OpenThoughts](#)

</begin_of_thought/> Okay, let's see. I need to solve this problem where three people (Chef, head server, sous-chef) have transceivers that can communicate directly if within R meters. If not, but there's a third person acting as a bridge, then they can still communicate. The goal is to check if all three can communicate with each other, possibly through the third.

Hmm. So for each test case, given R and three points, determine if the three form a connected graph where each pair is either directly connected (distance $\leq R$) or connected via the third.

Wait, but how exactly? Let's think. The communication can go through one intermediary. So all three must be in a chain where each consecutive pair is within R , ...

Openness of models

- **Closed models:** They are only accessible via an API. Example: GPT-models.
- **Open-weight models:** You can download the models (weights), but not much is known about the development process, including the exact training data used. Example: Llama models (Meta)
- **Fully open models (rare...):** You can download the models, and the used datasets, training details etc. are all available. Example: SmolLM3 (Hugging Face)

Resources

Hugging Face Transformers

- Very popular library for (Large) language models
- Active community
- Also stores many models and datasets (and you can add your own).
